Frank,

I have reviewed the October through December 1999 quarter report from Lenox dated December 22, 1999. TCE concentration at sentinel wells MW77 and MW79A is still higher than the standard of 1 ppb and actually has been increasing since the last three quarters. At MW77, it has increased from 2.0, 2.6 to 3.3 ppb and at MW79A from 1.0, 1.4 to 2.1 ppb. It appears to become more non-compliant with the Permit and MOA conditions rather than statistical fluctuation or anomalies. They may have to begin to think about installing new sentinel wells further out or instituting additional groundwater pumping near the MW77 and MW79A.

What do you think?

Andy
